

CSS Layout Fundamentals

Topic: design

Modern CSS layout is built on Flexbox and Grid.

Flexbox is ideal for one-dimensional layouts: navbars, toolbars, and evenly spaced rows. Use `display: flex`, `justify-content` for main-axis alignment, and `align-items` for the cross axis.

Grid shines for two-dimensional layouts: full pages, card galleries, and dashboards. Define columns with `grid-template-columns` and place items with `grid-column` and `grid-row`.

Practical pattern for a blog:

- Header: flex row with logo, search, and actions
- Main: grid of article cards (`repeat(auto-fill, minmax(280px, 1fr))`)
- Article body: max-width container with readable line length

Prefer gap over margin hacks, and use relative units (rem, %) so layouts scale cleanly.
