

Getting Started with React

Topic: tech

React is a JavaScript library for building user interfaces. You write components â reusable pieces of UI â and compose them into pages.

Start with a function component that returns JSX. Pass data with props. Keep changing data in state with `useState`. When state updates, React re-renders the component so the UI stays in sync.

Recommended first steps:

1. Create a Create React App or Vite project.
2. Build a small counter component.
3. Split the UI into Navbar, List, and Card components.
4. Lift shared state up when siblings need the same data.

Once those feel natural, move on to effects, routing, and data fetching.
