

Local-First Web Apps

Topic: tech

Local-first apps keep core features working without remote services. Content lives in the repo (JSON, Markdown, PDFs). Search and filters run in the browser.

Benefits:

- No API keys to rotate or leak
- Offline-friendly demos
- Predictable performance
- Easier onboarding for new developers

Trade-offs:

- You maintain the content catalog
- No live third-party news feeds
- Updates require a rebuild or content deploy

BlogMania in this project follows that model: articles come from `src/data/articles.json`, optional PDFs live under `public/pdfs/`, and topic search is pure client-side filtering.
