

Writing Clear Technical Posts

Topic: career

Good technical writing is about reader outcomes, not author brilliance.

Open with the problem and who it is for. Promise one clear takeaway. Use short paragraphs and concrete examples. Prefer numbered steps when order matters.

A simple structure that works:

1. Hook â why this matters now
2. Context â what the reader needs to know
3. Core explanation â diagrams, code, or examples
4. Pitfalls â common mistakes
5. Next steps â where to go from here

Edit ruthlessly. Cut jargon or define it on first use. Read the draft out loud; awkward sentences become obvious.

If you ship content as PDFs, keep the same outline. Your blog cards should use the title and first paragraph as the description so skimmers can choose quickly.
